

User Management Stack

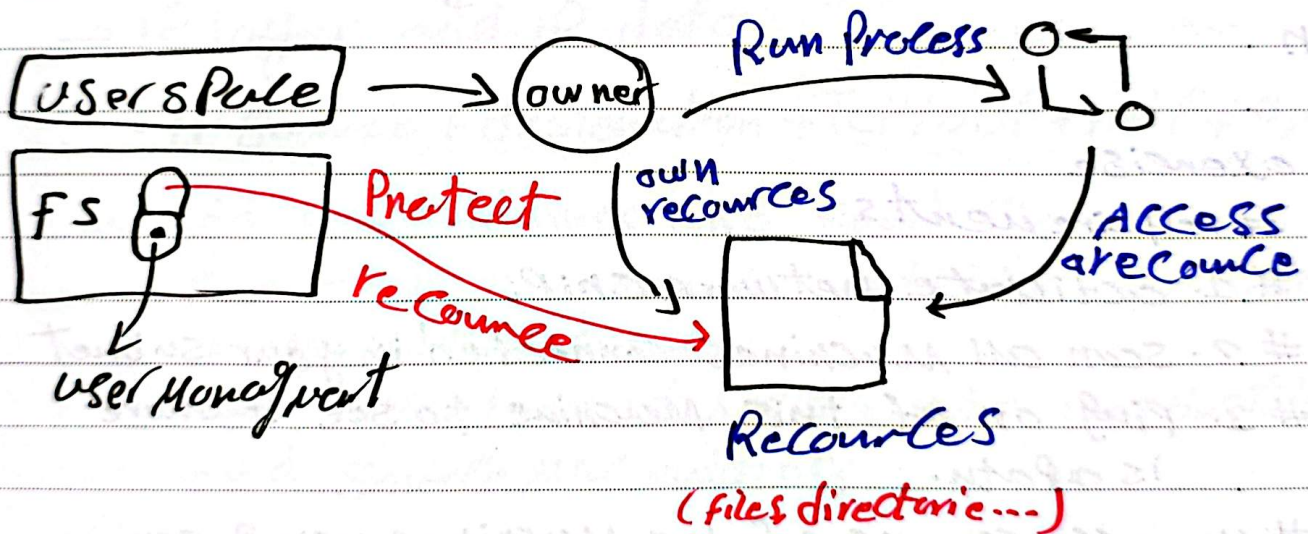

- Linux is a Multi-user Environment
- Every thing is a file

* because linux is a Multi-user Environment we need to handle Privacy between users

User Management: is a sub component of File System Stack it responsible for about users data Privacy

• used to protect files from accessing by non-authorized users

Scenario:

→ Permissions

-rw-rw-r--

File type	owner	Primary Group of users have the same Permissions	other users Permissions
- normal file	r read		
d directory	w write		
	x execute		
	- no Permission		

• Concepts:-

• user

normal user

→ Password
→ Home directory
→ ID ≥ 1000

system user

→ ID ≤ 999
→ Responsible for sys. processes

superuser

→ special permission

→ sudo Group
• Group: For sharing Permissions
↳ normal Group
